1 Generating Gaussian distributed random variables

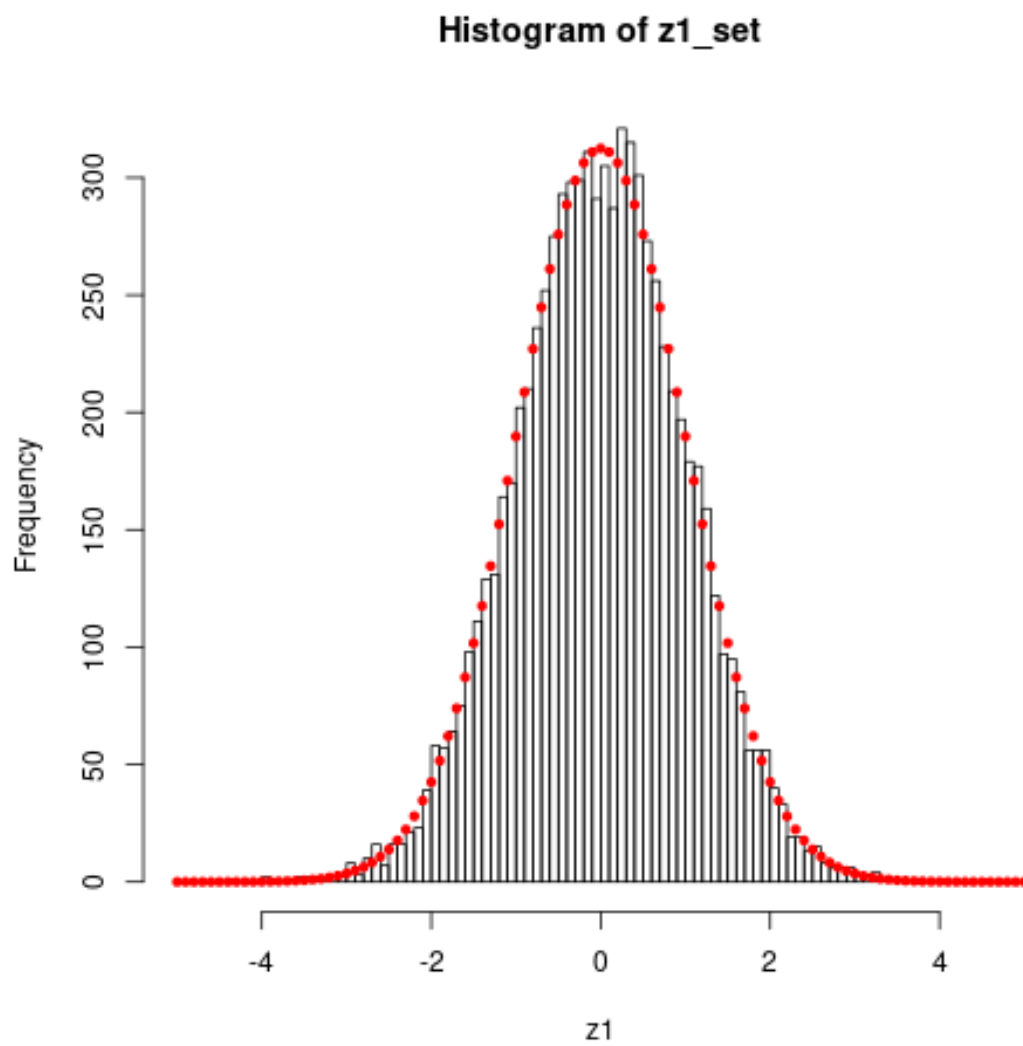

We are to create uniformly distributed points in a unit circle and show the values for z_1 and z_2 are gaussian distributed

```
1 num_randoms = 10000
2
3 orig_set = runif(num_randoms*2, min = -1, max = 1)
4 dim(orig_set) = c(2,num_randoms)
5
6 calc_set = orig_set[,1]**2 + orig_set[,2]**2
7 used_set = orig_set[,calc_set <= 1]
8
9 z1 <- function(vec) {
10   return(vec[1]*sqrt(-2*(log(vec[1]**2+vec[2]**2))/(vec[1]**2+vec[2]**2)))
11 }
12
13 z2 <- function(vec) {
14   return(vec[2]*sqrt(-2*(log(vec[1]**2+vec[2]**2))/(vec[1]**2+vec[2]**2)))
15 }
16
17 z1_set = 1:length(used_set[,1])
18 z2_set = 1:length(used_set[,2])
19 for (i in 1:length(used_set[,1])) {
20   z1_set[i] = z1(used_set[,i])
21   z2_set[i] = z2(used_set[,i])
22 }
23
24 pos_set = seq(-5,5,.1)
25
26 png('ex11.png')
27 h1 = hist(z1_set, breaks=pos_set, xlab='z1')
28 yfit1 = dnorm(pos_set, mean=0, sd=sd(z1_set))
29 yfit1 = yfit1 * diff(h1$mids[1:2])*length(z1_set)
30 points(pos_set, yfit1, cex=1, pch=20, col='red')
```

```

31
32
33 png('ex12.png')
34 h2 = hist(z2_set, breaks=pos_set, xlab='z2')
35 yfit2 = dnorm(pos_set, mean=0, sd=sd(z2_set))
36 yfit2 = yfit2 * diff(h2$mids[1:2])*length(z2_set)
37 points(pos_set, yfit2, cex=1, pch=20, col='red')

```

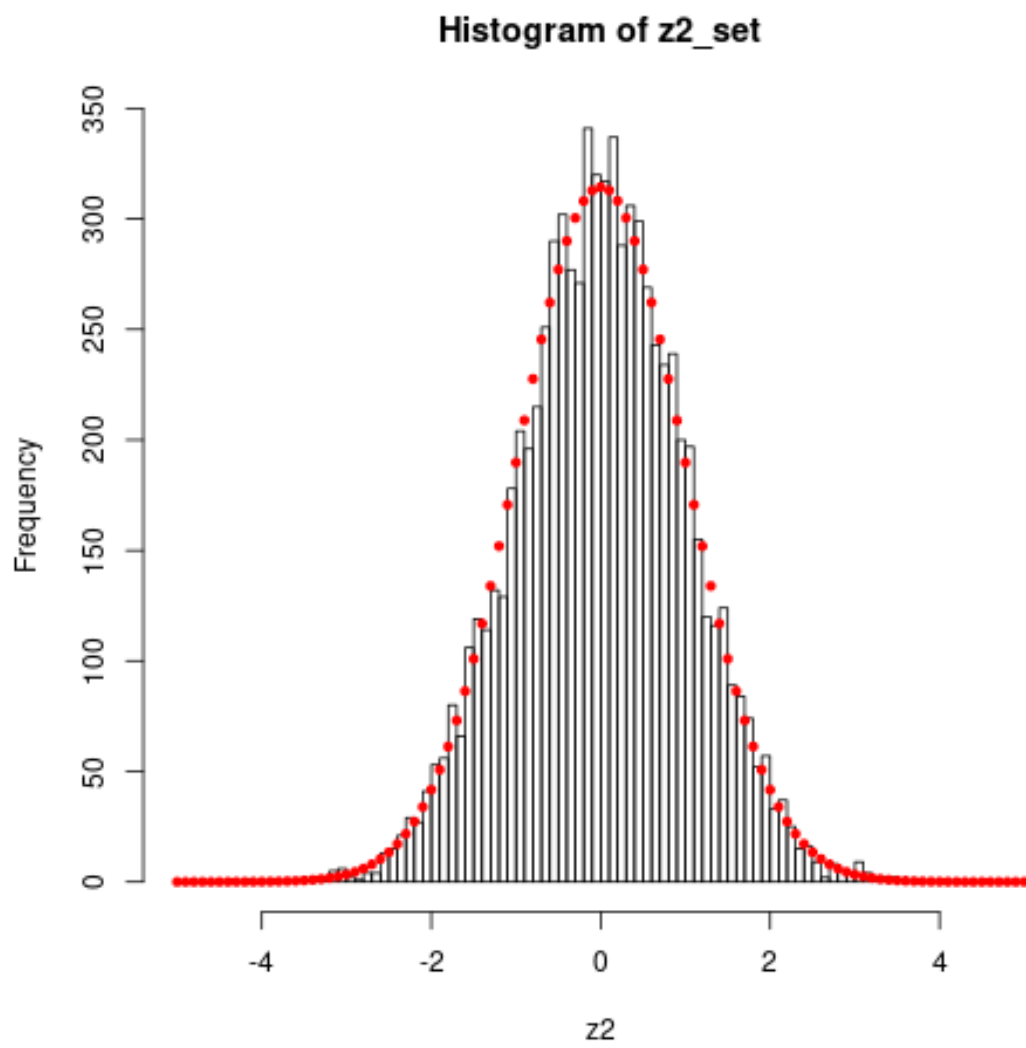

Figure 2: histogram of z_2 and gauss-fit

2 Random Walk

We generate the mean number of steps needed for a 1D random walk as a function of the distance n

```
1 rand_walk <- function(nmax) {
2   pos = 0
3   steps = 0
4   while (pos < nmax && pos > -nmax){
5     step = sample(0:1,1) *2 -1
6     pos = pos + step
7     steps = steps +1
8   }
9
10  return(steps)
11 }
12
13 dist_rand_walk <- function(n){
14
15   num_tests = 100
16   res = 1:num_tests
17   for (i in 1:num_tests) {
18     res[i] = rand_walk(n)
19   }
20
21   return(res)
22 }
23
24 nset = 1:50
25 means = 1:max(nset)
26 for (i in nset){
27   means[i] = mean(dist_rand_walk(i))
28   print(i)
29 }
30 png('ex2.png')
31 plot(
32   nset, means, pch=20, cex=1,
33   xlab='n:_width_of_exprimental_area', ylab='average_number_of_steps_needed'
34 )
```

Figure 3: ex2.R

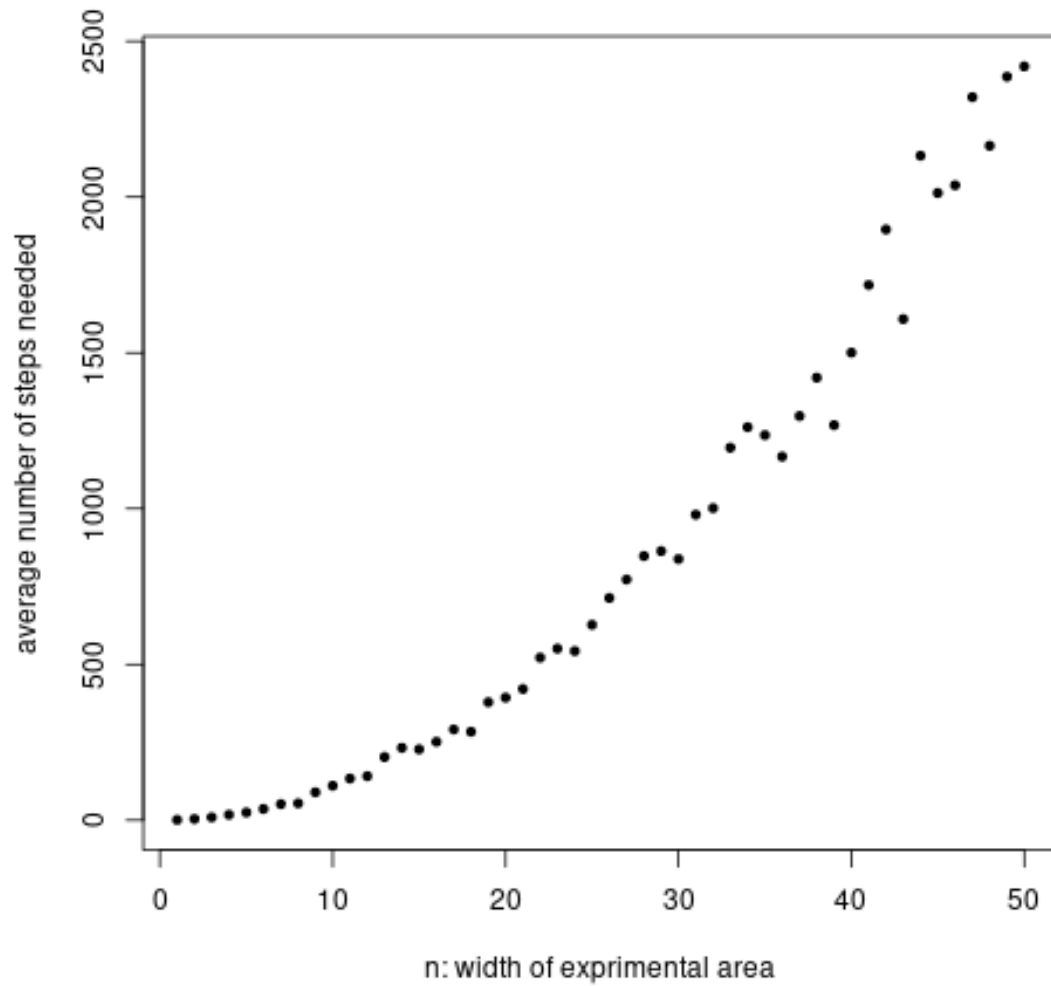

Figure 4: average number of steps taken as a function of n , in 50 tests per n

we can assume the number of steps required rises exponentially with the distance n
